

The artifact is an analysis and assessment on the returns of products by state and by product being returned. It was created in a Database course for looking into the use of SQL commands on a csv file. The artifact is in my portfolio because it shows a mastery of getting csv files set to SQL databases and then manipulated into useable data. The artifact has been improved with the inclusion of a gap analysis to show what data is missing from the original dataset and what could be added to improve the useability of the data. It demonstrates the ability to take new information and make it useable along with the ability to communicate in clear and professional ways.

I learned more about how SQL and csv files work for joining tables and getting the information there. I think I am going to further improve the enhancement by including graphs on the data and showing the impact of useful information. The challenges were trying to determine how the data could be collected to help meet the gap between the current state of data to a future state that has improved data quality.
